

DATASHEET

3FG15

v1.9

1. Datasheet

1.1. 3FG15

General Properties		Minimum	Typical	Maximum	Unit
Payload Force Fit 	Grip	- -	- -	10 22	[kg] [lb]
	Flexible grip	- -	- -	8 17	[kg] [lb]
Payload Form Fit 		- -	- -	15 33	[kg] [lb]
Grip Diameter*	External 	4 0.16	- -	152 5.98	[mm] [inch]
	Internal 	35 1.38	- -	176 6.93	[mm] [inch]
Finger position resolution		- -	0.1 0.004	- -	[mm] [inch]
Motor torque on finger platform (z)**		-	-	5.3	[Nm]
Diameter repetition accuracy		- -	0.1 0.004	0.2 0.007	[mm] [inch]
Gripping force	Grip	10	-	240	[N]
	Flexible grip	10	-	140	[N]
Gripping force (adjustable)		1	-	100	[%]
Gripping speed (diameter change)		-	-	125	[mm/s]
Gripping time (including brake activation)* * *		-	500	-	[ms]
Minimum necessary finger movement		4	-	-	[mm]
Hold workpiece if power loss?		Yes			
Storage temperature		0 32	- -	60 140	[°C] [°F]
Motor		Integrated, electric BLDC			
IP Classification		IP67			
Dimensions [L, W, Ø]		156 x 158 x 180 6.14 x 6.22 x 7.08			[mm] [inch]
Weight		1.15 2.5			[kg] [lb]

* With the scope of delivery.

** See where torque is applied in [Maximum Allowed Torque](#).

*** 10 mm diameter distance. Also see section [Gripping methods](#).

Operating Conditions	Minimum	Typical	Maximum	Unit
Power supply	20	24	25	[V]
Current consumption	43	-	1500 ***	[mA]
Operating temperature	5	-	50	[°C]
	41	-	122	[°F]
Relative humidity (non-condensing)	0	-	95	[%]

*** 600 mA set as default.

Warranty: 3 years or 3,000,000 cycles, whichever comes first, in accordance with the official warranty terms outlined in the Partner Agreement.

Fingers

The supplied fingers can be mounted in 3 different positions to achieve different **Gripping Forces** and different **Gripping Diameters**.

The delivered finger length is 49 mm (L in the drawing below). If custom fingers are required, they can be made to fit the gripper according to the dimensions (mm)[inch] shown below. The needed screws are M4x8mm (use 3 Nm tightening torque):

Fingertips

The supplied fingertips are listed below. Different fingertips will allow to achieve different **Gripping Forces** and different **Gripping Diameters**.

- Ø10 mm steel
- Ø13 mm steel
- Ø13.5 mm silicone
- Ø16.5 mm silicone

If custom fingertips are required, they can be made to fit the gripper's fingers according to the dimensions (mm)[inch] shown below. The needed screws are M4x8mm (use 2.5 Nm tightening torque):

Maximum Allowed Torque

This section is important if custom fingers or fingertips are used.

The maximum allowed torque applied to the gripper finger platforms around X and Y is 12 Nm.

The maximum allowed torque applied to the gripper finger end around X and Y is 2.5 Nm.

The pictures above show the coordinate system from where the maximum allowed torques are calculated.

X-shape Fingertips

These fingertips improve the gripper's ability to pick and place round workpieces with collar like features. By combining the force fit and the form fit gripping approaches, the fingertips increase the stability and payload of the workpiece to be gripped.

When these fingertips are used, set the fingertip diameter to 16 mm in the robot program. These fingertips are optional accessories and need to be purchased separately. To purchase these fingertips, please contact the distributor.

- 3FG X-Shape Fingertips PN 106963.

Knurled Fingertip Set

Designed with a knurled surface, these fingertips increase friction and payload capacity, making them optimal for gripping and moving raw and oil-coated workpieces in CNC machines.

NOTE:

The knurled fingertip may leave marks on the material.

Set the robot program to a 13 mm diameter when using these fingertips. They are optional accessories, sold separately. Contact the distributor for purchase.

- Knurled Fingertip Set PN 113929.

Internal/External grips

In the document the internal and external grip terms are used. These grips are related to how the workpiece is gripped.

External grip	Internal grip
	

Gripping methods

There are two different gripping methods how the 3FG15 can be operated. With each method, both internal and external gripping can be used.

Normal grip	Flexible grip
Use this gripping method if: - the diameter of the object is known and does not vary - more than 140 N gripping force is needed	Use this gripping method if: - the diameter of the object is not known or varies significantly - up to 140 N gripping force is sufficient

Normal grip

The gripping action has two phases:

Phase 1: For a safety reason, the fingers will start moving with a lower force (<140 N) to avoid damaging anything that could get clamped between the gripper fingers and the workpiece. The 3FG15 will apply a force of 50 N during this phase.

Phase 2: When the gripper diameter is very close to the programed target diameter, the gripper will increase the force to grip with the programed target force. After the grip, a break will be activated (tic sound). The activation of the brake, also known as, Force grip detected, can be verified in the provided functions. This brake will hold the workpiece with the applied force, with no power consumption and holding the workpiece in case of power loss. This brake will automatically be deactivated when the gripper performs a release or a new grip command. While programming the gripper, the brake can be deactivated by using the features in the GUI.

Flexible grip

The fingers will start moving with the set target force. If the gripper gets in contact with the object, it will grip with the programmed target force. After the grip, a break will be activated (tic sound). The activation of the brake, also known as, Force grip detected, can be verified in the provided functions. This brake will hold the workpiece with the applied force, with no power consumption and holding the workpiece in case of power loss. This brake will

automatically be deactivated when the gripper performs a release or a new grip command. While programming the gripper, the brake can be deactivated by using the features in the GUI.

NOTE:

The achievable gripping speed is affected by the following parameters:

1. Using lower target force (F) than 100% can reduce the gripping speed.
2. The size of the target diameter: the bigger the target diameter (gripping near to fully open position), the lower the achievable gripping speed.

Gripping Force

The total gripping force highly depends on the finger angle θ . For both internal and external grip, the lower the finger angle, the higher the force that will be applied.

The angle range of an external grip is 30-165 degrees and internal grip is 20-160 degrees.

The graph below shows what force can be achieved for a specific diameter depending on the finger position when using the Normal grip function. The graph is plotted using measurements with the standard fingers in all 3 positions, steel fingertips Ø10 mm and a metal workpiece. The Flexible grip force is also shown in dotted line.

**NOTE:**

The total force applied depends on the finger angle, the input current (limited in some robots' tool flange connection) and the friction coefficient between the materials of the fingertips and the workpiece.

Gripping Diameter

The different configurations of the delivered finger and fingertips allow to achieve a wide range of diameters.

Finger Position	Fingertip (mm)	External Gripping range (mm)	Internal Gripping range (mm)
1	Ø10	10 - 117	35 - 135
	Ø13	7 - 114	38 - 138
	Ø16.5	4 - 111	41 - 140
2	Ø10	26 - 134	49 - 153
	Ø13	23 - 131	52 - 156
	Ø16.5	20 - 128	55 - 158
3	Ø10	44 - 152	65 - 172
	Ø13	41 - 149	68 - 174
	Ø16.5	38 - 146	71 - 176

Based on:

- Angle for external gripping min 165° (Pos 1), 163 ° (Pos 2), 161 ° (Pos 3) and max 30° (all 3 positions)
- Angle for internal gripping min 160° and max 30°

The closer to the maximum diameter range, the lower the angle and, therefore, the higher the force.

1.2. 3FG15 box content

1.3. 3FG15

All dimensions are in mm and [inches].
